

# The State of AI

"AI is the new electricity"

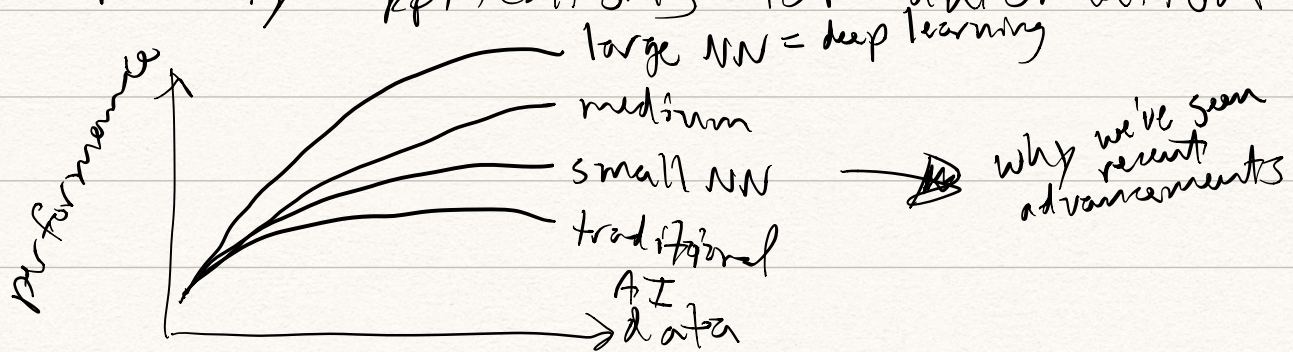

So far 99% of value has been from solving  $A \rightarrow B$  problems

Ng: "anything typical person can do w/ 1 sec of thought we can probably now, or soon, automate"

↳ not perfect, but good heuristic

↳ gave to product managers to help them identify applications for automation

## Types of AI

Supervised ( $A \Rightarrow B$ )

transfer learning

unsupervised learning

reinforcement learning

↑ most  
value

↓ least  
value

Algorithms are not defensible, but  
data is

↑ open  
source

Launching a product:  
virtuous cycle  
don't need all data b/f launching

unique, niche data is valuable

- ↳ ex: company gathered/took pictures of heads of lettuce; use to identify health
- ↳ data large tech firms don't have

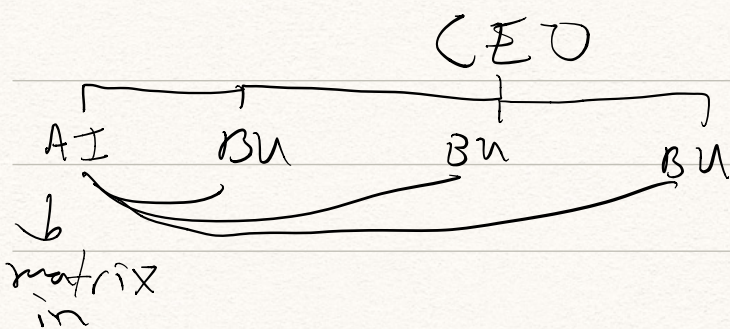

Why shopping mall + website  $\neq$  internet company

- A/B testing
- short cycle time
- decisions made by eng./PMs

## Traditional internet company + NN ~~AI~~ company

- strategic data acquisition
- unified data warehouse
- pervasive automation
- new job descriptions

- matrix in ~~AI~~ to start
- after maturing, hire directly into BUs
